

## Void Spaces & Hidden Fire

Void spaces in a structure can be a fire fighters worst enemy. Heat and smoke have a natural tendency to take the path of least resistance and travel throughout a structure. Unfortunately, that means that fire can extend into many of these void spaces unless the spaces are identified and thoroughly checked.

- How are void spaces identified and inspected during operations?
- How can void spaces be identified from the outside of a structure?
- Describe your departments operations while searching for fire in void spaces.
